AUTHOR: Yevstigneyev, G.P., Candidate of Economic Sciences, Docent

TITLE: To Establish a Vuz - a Mechanized Accounting Plant

PERIODICAL: Vestnik vysshey shkoly, 1959, Nr 4, pp 22-24 (USSR)

ABSTRACT: Lately, the Moscow Economic - Statistical Institute conducts its work in close cooperation with the plants of the Moskovskiy gorodskoy sovnarkhoz (Moscow Municipal Sovnarkhoz), thereby improving the training of specialists in the mechanization of recording and calculating work. In the 1957/58 school year, students spent 1,500 working days at the 4 plants - "Kalibr", "Krasnyy Proletariy", imeni M.I. Kalinin and the Presnenskiy mashinostroitel'nyy zavod ("Presnenskiy" Machine Building Plant) - carrying out graduation tasks or participating in the realization of projects. Over 150 students studied initial documentation at 53 plants; in the course of 2 months, 160 students participated in compiling the RSFSR balance of national economy at the Statisticheskoye upravleniye (Statistical Administration), staying there for more than 1,400 working days. The work of instructors of the

Card 1/3

SOV/3-59-4-6/42

To Establish a Vuz - a Mechanized Accounting Plant

Chair "Computing Machines and Their Exploitation" deserves mentioning: In 1957 and 1958 the Chair developed and brought into use a relay attachment to the sorting machine S45-6 designed to control logically incompatible indications contained in replies to questions of the census sheet. This device effectively helps to withdraw perforated cards containing contradictory data transferred from census sheets. For the processing of the All-Union census data, 120 machines with relay attachments were manufactured and installed in 57 mechanical computer stations of the republic and oblast' statistical administrations, and in the Tsentral'naya mashinoschetnaya stantsiya (Central Mechanical Computer Station) of the All-Union census. The economical effect of applying the attachment will amount to 8 million rubles according to the calculations of the Otdel mekhanizatsii Upravleniya po provedeniyu Vsesoyuznoy perepisi naseleniya TsSU JSSR (Department for Mechanizing the Administration of the All-Union Census TsSU USSR). The students' work in designing and applying new engineering methods deserves special attention. In the summer of 1958, 62 students participated

Card 2/3

SOV/3-59-4-6/42

To Establish a Vuz - a Mechanized Accounting Plant

in making logical schemes for an electronic machine used for processing statistics. This year, the electronic ciphering machine will be assembled, and in 1960 a program for the processing of material will be composed. The author explains how the problem of finding work for the students was solved by sending all 4th course students to the Central Mechanical Computer Station, where the students have good possibilities for scientific work. However, it complicates the proper arrangement of training. This could probably be overcome if large non-state-financed mechanical computer plants were united with vuzes thereby establishing a plant-vuz. Their training and production schedule will change from time to time in accordance with requirements in specialists for one or the other branch. Since the Central Mechanical Computer Station will finish processing the basic indices of the All-Union census by the end of the year, the author suggests that the station be reorganized into a mechanical computer plant and a plant-vuz established.

Title : Well drilling with forced water flushing

Periodical : Neft. Khoz., v. 32, #6, 17-22, Ju 1954

Abstract : Improvements for reduction of the cost of drilling in various oil fields of the Tuymazaburneft' trust are described. The improvements are related mainly to adoption of modern technological processes and modification of outdated technical standards and regulations. Water flushing in drilling is widely used instead of the drilling fluids with mud in order to increase the speed and to reduce the required power for pumping. The hydraulic resistance of water is about 30% less than that of drilling mud fluids and the power for water pumps is about half as large as that for the drilling fluids. Comparative drilling operation data are presented in two tables.

TITLE:

Investigation of endurance of titanium-base and other
heat-resistant alloys tested on the ВИУ-1 МАИ-ВИАМ
(VIU-1 MAI-VIAM) machine under high frequency loads

PERIODICAL:

Moscow. Aviationsionnyy institut. Trudy, No.129, 1960.
Issledovaniye fizikomekhanicheskikh i ekspluatatsionnykh
svoystv detaley posle obrabotki, pp. 92-111

TEXT:

The object of the investigation described in the present paper was to determine the endurance limit of a titanium alloy BT3-1 (VT3-1) and two nickel-base alloys of the 9Н617(EJ617) and XС6К (ZhS6K) type, and to study the effect of the frequency of alternating loads on this property. The main shortcoming of the conventional fatigue testing methods is that the test conditions bear little relation to the conditions obtaining in service; in addition, they are time-consuming, 4-5 months of continuous work being required to construct on fatigue curve. It was for these reasons that a high frequency testing machine (VIU-1 MAI-VIAM) was

Card 1/9

25967

S/535/60/000/129/005/006
E193/E580

X

Investigation of endurance of ...

used in the present investigation. The machine (whose detailed description is given) is of the resonance type and was designed for single-plane bending fatigue tests which can be carried out under the conditions of both imposed and resonance vibrations. The vibrations, generated by a powerful electromagnetic system consisting of an amplifier and a transformer, are transmitted to the test piece through a heavy beam, capable of producing alternating loads which are sufficiently high to break standard test pieces or even actual components, such as turbine blades. The auxiliary equipment consists of a microscope used for setting the test piece and for measuring the vibration amplitude which at high temperatures is measured with the aid of a cathetometer, and an electrical resistance furnace for high temperature work. Before testing, the test pieces were heat treated according to schedules given in Table 2. The tests were carried out on cylindrical test pieces of the cantilever type. The gauge length ℓ of the test pieces varied depending on the load frequency and test temperature, and was calculated from the formula

$$\ell = \sqrt{\frac{(1.8751)^2}{2\pi f}} \sqrt{\frac{EJ}{m}}$$

Card 2/9

Investigation of endurance of ...

25967

S/535/60/000/129/005/006
E193/E580

where τ is the vibration frequency per sec, E the modulus of elasticity (kg/mm^2), J the moment of inertia (mm^4), and m mass per unit length ($\text{kg.sec}^2/\text{mm}^2$). The tests were conducted on a base $N = 10^8$ cycles in the case of the EI617 and ZnS6K alloys, and 10^7 and 10^8 cycles in the case of the VT3-1 alloy. Each fatigue curve was constructed from data obtained on eight test pieces. In the first test of each series a stress equal approximately to $0.5 \sigma_b$ was used, where σ_b is the U.T.S. of the alloy tested; in each subsequent test the applied stress was lowered by 2 kg/mm^2 . The vibration amplitude, A (mm), of the free end of the test piece, required to produce a given stress, was calculated from the formula

$$A = 0.5682 \frac{\ell^2}{Ed} \sigma_1$$

where ℓ and d are the length and diameter of the specimen, respectively, E the modulus of elasticity (kg/mm^2), and σ_1 the applied stress (kg/mm^2). The results are reproduced in Figs. 10-13, where the stress σ_{-1} (kg/mm^2) is plotted against the number of cycles to fracture. The fatigue curves in Fig. 10 relate to alloy EI617, tested at 20°C under the following conditions: (1) testing

Card 3/9

4/535/60/000/129/005/006
E193/E580 X

Investigation of endurance of ...

machine of the ГЗИП(GZIP) type (bending of the revolving specimen), load frequency $f = 50$ cycles/sec; (2) testing machine of the П-391 (P-391) type (bending of a revolving specimen), $f = 200$ cycles/sec, (3) testing machine VIU-1 MAI-VIAM (single plane bending), $f = 1000$ cycles/sec. The fatigue curves in Fig.11 relate to alloy ZhS6K tested at 20°C , the testing conditions for curves 1-3 being the same as in Fig.10. The results, reproduced in Fig.12 relate to alloy VT3-1 tested under the following conditions: curve 1 - testing machine VIU-1 MAI-VIAM, $f = 1100$ cycles/sec, $t = 20^\circ\text{C}$; curve 2 - same as for curve 1, except $f = 420$ cycles/sec; curve 3 - testing machine GZIP, $f = 50$ cycles/sec, $t = 20^\circ\text{C}$; curve 4 - testing machine VIU-1 MAI-VIAM, $f = 420$ cycles/sec, $t = 400^\circ\text{C}$. Fig.13 shows the fatigue curves of the VT3-1 alloy, tested at 20°C on the VIU-1 MAI-VIAM machine, curves 1-3 relating to tests carried out at $f = 450$, 1100 and 1650 cycles/sec, respectively; these are the most significant results of the present investigation, showing that the endurance limit of the alloys studied increased with increasing load frequency. Metallographic examination of the fatigue test pieces in the region of fracture revealed no changes in the microstructure

Card 4/9

25957

Investigation of endurance of ... 8/535/60/000/129/005/006
E193/E580

due to increased loading frequency. The fatigue cracks were trans-crystalline, and only in the zone of final fracture were intergranular cracking and some degree of plastic deformation of the grains observed. It was concluded that both the equipment used and the method employed by the present authors are suitable for fatigue testing under high frequency loading and give reliable results which can be used as design data in the production of turbine and compressor blades, operating under high frequency loads. There are 15 figures, 5 tables and 6 references: 1 Soviet and 5 English. The English-language references read as follows: Lomas T., Ward I., Rait, I., Colbeck E., International Conference on Fatigue of Metals, London, Sept., 1956; Krouse G., Proc. ASTM, 34, 1934, II, 156; Jenkin C. and Lehman G., Proc. Roy. Soc., 125, 1929, 83; Wade A and Grootenhuis P., International Conference on Fatigue of Metals, London, Sept., 1956.

TITLE:

Investigating the effect of technological factors on the
endurance of refractory alloys in high-frequency loading

SOURCE:

Moscow. Aviatsionnyy institut. Trudy, no. 140. Tekhnologicheskiye metody povysheniya kachestva detalei i uzlov aviadvigateley. 1961, 71-112

TEXT: The authors deal with investigating the effect of 7 different methods of treatment on the durable strength of the alloys 3A 617 (EI617) and 3M 867 (EI867). The methods are: Milling with subsequent polishing; milling with subsequent grinding; mechanical polishing preceded by grinding and milling; electro-polishing preceded by mechanical polishing, grinding and milling, etc. A detailed description of the methods of treatment employed is given, with numerical data, such as the size of the cutter, velocity etc. [Abstracter's note: The specimens

Card 1/32

Investigating the effect...

are described as "plane and rectangular" in the text but their actual shape is as in Fig. 14]. All tests were carried out on an electro-dynamical vibrator which is described in detail. For heating specimens, in the process of testing, a special high-temperature resistance furnace was used which is also described. Thermal calibration of the specimens was made before testing. After the mechanical treatment, the depth of work hardening and the residual stresses were determined; the former by an X-ray method and the latter by N.N. Davidenkov's method; details of the results are given. The specimens were tested for endurance on bending, with the frequency of resonance vibrations of the order of 850-1000 cycles, at 850°C. Graphs of the results are given. It was found that the endurance depends on the method of treatment and is increased by finishing methods which reduce the residual tensile stresses and the depth of work hardening. The authors recommend electric and mechanical polishing. Thermal treatment also increases the limit of durable strength. There are 26 figures, 5 tables and 15 Soviet-bloc references.

TITLE: Dark and photochemical reduction of metal derivatives of a number of porphins

SOURCE: AN SSSR. Doklady, v. 167, no. 1, 1966, 135-138

TOPIC TAGS: photchemistry, chemical reduction, pyridine, methanol, hydrazine, atom, hydrogenation, chlorine compound

ABSTRACT: The relationship of the reduction of porphin type molecules to the presence and nature of a central metal atom was investigated in the following porphin metal derivatives: M-TFP (M = Zn, Mg, Cd, Cu, Ni), Zn- and Cu-TMP, Zn- and Mg-EP (TFP = meso-tetraphenylporphin, TMP = 1,4,5,8-tetramethylporphin, ED = ethioporphin-1).

Photo-reduction was conducted under vacuum in pyridine and methanol at pigment concentrations of 10^{-5} mole/liter in the presence of hydrazine (1-2 moles/liter) or H_2S with 500 mm Hg equilibrium gas pressure over the solution. Illumination of the solutions was done with the total light of a 500 watt incandescent lamp equipped with a reflector and condenser.

The effect of the central metal atom in the pigment molecule is different in dark and photochemical reduction reactions. In dark reaction with hydrazine, the hydrogenation of the pyrrole rings occurs equally successfully in Cu-, Ni- and Zn-containing pigments, depending more on the character of the peripheral substituents than on the central metal atom. In the photochemical interaction, only the Zn- and Mg- derivatives (and, possibly, Cd-derivatives) appear active, regardless of the nature of the substituent in the 1-8 positions (in the limits of the compounds studied), but the Cu- and Ni-derivatives appear inactive. Upon comparing the Zn- and Mg-containing pigments, the photohydrogenation of the pyrrole rings occurs in Zn-derivatives in the presence of hydrazine, with the formation of the corresponding chlorines and bacteriochlorines, but it does not occur in Mg-derivatives. It can be assumed that such differences in the metal-containing pigments are caused either by their special properties in optically stimulated states, or by their dissimilar capacity for complex formation with molecules of the medium. This paper was presented by Academician A. N. Terenin on 15 May 1965. Orig. art. has: 4 figures.

Absorption spectra of magnesium phthalocyanine. V. B. Eustishevsky and A. A. Krasnovskii (A.N. Bakh Biochem. Inst., Moscow). Doklady Akad. Nauk S.S.R. 58, 417-20 (1947).—Mg phthalocyanine crystd. from pyridine retains $^{21}\text{H}_2\text{O}$ and free phthalocyanine which cannot be removed even by sublimation *in vacuo*. The free phthalocyanine can be removed by agitation with Me_2CO until intense color disappears and the soot, on evapn., gives a pure Mg deriv. The following max. were obtained: in Me_2CO 665, 638, 601, 344 m μ ; in Et_2OH 668, 640, 605, 344, 283; in Et_2O 668, 638, 601, 244; in pyridine 673, 647, 608, 340; in dioxane 666, 638, 612, 344; in C_6H_6 672, 646, 608, 346; in Merb 672, 646, 609, 346; in 1,2,4-tetrahydrophthalene 672, 646, 609, 347; in 1-BrC₆H₅ 678, 640, 613, 355; in solid film 630, 335, 290. The spectra resemble those of chlorophyll in band positions and intensities. G. M. Kosolapoff

Spectrophotometric characteristics of wines and cognacs. N. M. Sinyan, V. B. Evstigneev, and I. A. Egorov (Bach-Blochens. Inst., Moscow). Bishkinova 12, 364-9 (1948).—A large no. of Soviet wines and cognacs were investigated with a Beckmann quartz spectrophotometer. The light absorption was measured in the range of 220 to 1000 m μ . Sherry wines and cognacs, in contrast to other wine varieties, show characteristic absorption max. in the neighborhood of 280 m μ . The value of the extinction coeff. at this max. is related to the quality of the sherry and cognac. The spectrophotometer is recommended as a valuable tool in the quality control of wines and cognacs. H. Priestley

of Magnesium Derivatives

"The Attenuation of the Fluorescence of Magnesium, "n"
Phthalocyanine and Chlorophyll by Foreign Molecules,"
Inst. Biol., V. B. Yevstigneyev and A. A. Krasnovskiy,
Chem. imen1 A. N. Bakh, Acad. Sci. USSR, 4 pp.

"Dok Ak Nauk SSSR" Vol LX, No 4

Description and results of subject experiments.
Description and results of magnesium phthalocyanine
fluorescence attenuations of magnesium phthalocyanine
and chlorophyll are similar, which proves that effect
is not connected with labile hydrogen atoms in
chlorophyll molecule and shows resemblance between
tetrazoporphin and porphin systems of conjugate double
bonds. Molecule oxidizers with electron affinity
(quinone, oxygen) greatly attenuate fluorescence of
pigments investigated while reducers (hydroquinone,
ascorbic acid, NaI and KI) are far less active. Sub-
mitted 12 Feb 1948.

Quenching of fluorescence of magnesium phthalocyanine and of chlorophyll by extraneous molecules. V. B. Brataginov and A. A. Krasnovskii. *Doklady Akad. Nauk S.S.R.* 60, 623-6 (1948).—The dependence on the nature of the solvent of the fluorescence, excited in the absorption max., 608 m μ for Mg phthalocyanine (I) and 604 m μ for chlorophyll (a + b) (II), in the concentration range of max. intensity of fluorescence ($0.25\text{--}0.40 \times 10^{-4}$ M) is illustrated by the data (intensities in relative units): at 7°, I in EtOH 95%, Me₂CO and CsH₁₁N, 81.6, 70.8, and 35.8, resp.; II, 40.0, 50.8, and 32.0. The following quenching efficiencies, in soln. in 95% EtOH, are expressed in % remaining of the original intensity, i.e. taking that of the pure O₂-free soln. as 100: I, at 7°, add. with O₂ 81.6%; at 10°, with quinone 0.0019, 0.0085, 0.016, 0.034, 0.066, and 0.122 M, 91.8, 70, 54, 33.6, 23.5, and 20.5%; at 12°, with hydroquinone 0.049, 0.129, 0.268, and 0.542 M, 98, 90, 77.5, 59.5%; II, at 7°, add. with O₂, 80.5%; at 12°, with quinone 0.0019, 0.055, 0.016, 0.031, 0.045, and 0.147 M, 95, 84, 63, 49, 30, and 25%; at 21°, with hydroquinone 0.061, 0.105, 0.228, 0.566, 1.10 M, 100, 96, 94.5, 92, and 80.5%. (Quenching by O₂ diminishes with increasing H₂O content in the EtOH; in the presence of 25% H₂O, no quenching is noticed. This is evidently due to the lesser solv. of O₂ in H₂O.) No quenching of the fluorescence of either I or II

was observed with KI, NaI, or ascorbic acid in add. soln. in alc., but distinct quenching of II is found at high concns. of KI or NaI in solas. contg. 20–25% H₂O. Absence of chem. interaction between the fluorescing substance and the quencher was tested by the constancy of the extinction coeff. E (in 608 and 604 m μ for I and II, resp.); shifts well in excess of the possible errr. error were observed on addn. of quinone; thus, for I, E (under 1 cm) changed from 0.810 to 0.501 with quinone 0.003 M, for II, from 0.282 to 0.232. However, addn. of quinone does not noticeably change the position of the max. or E in the ultraviolet for I, in the blue-violet for II. Evidently, I and II behave alike with respect to quenching of their fluorescence. Only oxidants (O₂, quinone) have a marked quenching effect; reducing agents are much less active.

Effect of oxygen on absorption spectrum and fluorescence of chlorophyll solutions. V. N. Krasikov, V. A.

Gavrilova, and A. A. Krasnovskii. *Doklady Akad. Nauk S.S.R.*, 60, 1133-8 (1949). Revacuation of air above toluene solns. of chlorophyll-a and -b results in a small drop of absorption intensity at both maxima and a 2-3% shift of the red band to the long-wave end; in chlorophyll-b the 400-70 band increases in intensity; readmission of air restores the spectrum to near-normal values, while for the 360-320 band the band shift takes place only partially reversibly. Many cycles lead to progressive decline of extinction coeff. in toluene, CCl_4 , and heptane; O-contg. solvents gave increased absorption on evacuation, proportional to vol. decrease (evapn.) and gave no change on air admission. Fluorescence declines on evacuation and partially rises on air admission with $a + b$ form, while b form gives complete recovery. A trace of ROH , Me_2CO , or pyridine in toluene soln. cancels the variation of extinction on evacuation and air readmission. Hence, interaction of O with chlorophyll shortens the duration of the active state of the latter and serves to depolymerize the dimeric form of chlorophyll (which does not fluoresce).

Influence of extraneous molecules on the absorption and fluorescence spectrum of magnesium phthalocyanine and of chlorophyll in solution. V. B. Ryutin, V. A. Gavrilova, and A. A. Krasnovskii (A. N. Bach Inst. Biophysics, Acad. Sci. USSR, Moscow). Doklady Akad. Nauk S.S.R. 70, 201-4 (1950); etc. C.A. 45, 1872a.—The decrease of the intensity of fluorescence of a soln. of chloro-

phyll in toluene on evacuation, and its restoration on admission of air, is due not to O₂ alone but primarily to H₂O vapor. Carefully dried O₂ has no effect on the fluorescence of the preliminarily outgassed soln. H₂O vapor alone was found to increase the intensity by a factor of 1.4; simultaneous presence of O₂ lowers this increase by about 10-20%. Consequently, O₂ quenches the fluorescence of a chlorophyll soln. in the presence of H₂O, also in a toluene soln. The effect of H₂O is not specific, but is common to a series of polar substances such as P(OH)₃, CH₃N, MeCO, and aniline. The fact that dry O₂ has no quenching action, can be explained by the superposition of an activating and a quenching effect. It must be assumed that O₂ has a similar action as H₂O, only to a much lesser degree. In contrast to chlorophyll, solns. of pheophytin (free from Mg) in toluene, show no change either of the fluorescence or of the absorption spectrum on evacuation or admission of air. However, Mg phthalocyanine in toluene shows a behavior analogous to that of chlorophyll; but the spectrum of Mg-free phthalocyanine in toluene is insensitive to outgassing or admission of air. Evacuation or admission of air does not affect the absorption max. at 620 and 655 m μ belonging to metal-free phthalocyanine, but the absorption max. at 672 m μ , which belongs to the Mg phthalocyanine compd., is decreased by evacuation, and increases again when air is admitted. Consequently, the detg. factor is the presence or absence of Mg as central atom. Substances which enhance the fluorescence of chlorophyll are coordinatively bound with the Mg atom. Possibly, this binding results in a discon. of the non-fluorescing dimer into fluorescing monomers, or in the formation of compds. between the chlorophyll and polar molts.

Effect of the pH of the medium on the decomposition of glucose solutions on heating. V. I. Rostovtsev and V. S. Nikiforova. *Doklady Akad. Nauk S.S.R.* 73, 523-6 (1950).--Ultraviolet absorption spectra were taken of glucose solns. boiled 30 hrs. at pH 2-9 (initially adjusted by addn. of HCl or NaOH); in all cases 2 bands, 230 and 292-3 m μ , were observed (the curves are reproduced) but the intensities underwent a profound change. The 230 m μ band develops most slowly at pH about 3 and the 290 m μ band has the least intensity at pH 4-6, both after boiling 1 hr. The latter band undergoes moderate frequency shifts with changes of pH; it is believed that the peak of 275-80 m μ corresponds to glucose with a free carbonyl group, while that of 282.5 m μ corresponds to (hydroxymethyl)furfural, which does not form at pH higher than 4.5-5.0. The results indicate that if the original pH is above 5, (hydroxymethyl)furfural forms rapidly only after the acidic products of decompr. lower the pH below that figure; the total decompr. of glucose is accelerated at pH above 5-6 owing to the presence of the free carbonyl form, while an acceleration below pH 3-4 is caused by rapid and extensive dehydration. The formation of the carbonyl form is facilitated by higher pH; the product loses H₂O on heating and yields the primary decompr. products absorbing at 230 m μ , but further dehydration to (hydroxymethyl)furfural is retarded by increased pH and is accelerated only if the pH is under 4-5. The intersection point of the 2 curves representing these factors lies at about pH 5 in brief heating periods at 100-2°, while for longer expts. it is about pH 3. These concepts have been confirmed by boiling glucose solns. 1 hr. at pH 3.05, 4.80, and 8.14, then adjusting to pH 1.5 by HCl and boiling 0.5 hr. longer; the absorption intensities at 282.5 and 230 m μ showed a progressive rise with the pH of the initial soln., an especially high value being obtained from the pH 8.14 soln. G. M. Koslapoff

34

Quenching of the fluorescence of chlorophyll and of magnesium phthalocyanin in their interaction with quenchers. V. B. Evstigneev, V. A. Gavrilova, and A. A. Krasnovskii (Akad. Nauk S.S.R., Moscow). Doklady Akad. Nauk S.S.R., 74, 315-18 (1950).—The following degrees of quenching of the intensity of the fluorescence of ($\alpha + \beta$) chlorophyll salts in EtOH were observed (quenchers 0.1 M): PhNO_2 08, $m\text{-C}_6\text{H}_4(\text{NO}_2)$, 47, 1, (0.005 M) Et_2NHMe , 29%; in pyridine, $p\text{-C}_6\text{H}_4\text{O}_2$, 04.5, PhNO_2 , 37, $m\text{-C}_6\text{H}_4(\text{NO}_2)$, 78%; in toluene, $p\text{-C}_6\text{H}_4\text{O}_2$, 03, PhNO_2 , 29, $m\text{-C}_6\text{H}_4(\text{NO}_2)$, 75%. The corresponding data for the quenching of the fluorescence of Mg phthalocyanin, are, in EtOH , PhNO_2 , 70, $m\text{-C}_6\text{H}_4(\text{NO}_2)$, 80, 1, (0.005 M) 38, PhNH_2 , 23, PhNMe , 71%; in pyridine, $p\text{-C}_6\text{H}_4\text{O}_2$, 00, $p\text{-C}_6\text{H}_4(\text{OH})_2$, 0, PhNO_2 , 31, $m\text{-C}_6\text{H}_4(\text{NO}_2)$, 80, PhNH_2 , 4, PhNMe , 37%; in toluene, $p\text{-C}_6\text{H}_4\text{O}_2$, 00, PhNO_2 , 50, $m\text{-C}_6\text{H}_4(\text{NO}_2)$, 81, PhNMe , 17%. Strong quenchers are, without exception, oxidants; reductants either do not quench at all or quench only very weakly. Simultaneous studies of the extinction in the red max. show that the strongly quenching quenchers, O_2

and $p\text{-C}_6\text{H}_4\text{O}_2$, are practically without effect on the absorption spectrum, whereas 1, and $m\text{-C}_6\text{H}_4(\text{NO}_2)$, decrease the absorption more markedly. Under strong illumination through a red filter, chlorophyll salts, in EtOH react strongly with O_2 (as evidenced by the rapid decrease of the red absorption max. with the length of exposure), hardly with $p\text{-C}_6\text{H}_4\text{O}_2$, and $p\text{-C}_6\text{H}_4(\text{OH})_2$, but do react with ascorbic acid, which is without effect in quenching of fluorescence. Nor does $p\text{-C}_6\text{H}_4\text{O}_2$ show any significant photoactivity in toluene salt. In pyridine salt, the photoextinction must intense with ascorbic acid, less intense with O_2 , and still less with $p\text{-C}_6\text{H}_4\text{O}_2$. Consequently, there is no direct correlation between the ability of substance to quench fluorescence and its photoactivity with chlorophyll. The absence of any rapid reversible photochemical reaction between chlorophyll salts, ($\sim 10^{-4} \text{ M}$) in EtOH , pyridine, or toluene, and quinone (0.1 M) was ascertained by illumination at right angle to the direction of the spectrophotometric observation. The absence of a relation between quenching and photochemical reactivity indicates that the latter is dead, not by the electronic excited state ($10^{-4} \text{ to } 10^{-3} \text{ sec.}$) but by the long-lived biradical triplet state. A COMPARISON OF THE PHOTO-CHEMICAL PROPERTIES
OF CHLOROPHYLL PHOSPHORYL PESTHAI & YASIN
AND ITS MAGNESIUM COMPLEX. V. P. Bratagam and
V. A. Yevstigneyev. Institute of Chemistry, Arad, USSR
B.E.P. 74, 1958. In: PERI TRAM 109, AEC ID
171.

The rate of photochemical oxidation and reduction reactions
of chlorophyll, its Mg-complex and other chlorins and its mag-
nesium complexes in the presence of various substances is discussed.
The effect of the nature of the substituents on the reactivity of mag-
nesium complexes is shown. It is shown that the photochemical
oxidation of chlorophyll and its magnesium complex is more
intense than the reduction. The absorption spectra of the reduced
chlorophyll and its magnesium complex are given.

The photoelectrochemical effect of phthalocyanins, chlorophyll, and pheophytin. V. B. Evstigneev and A. N. Tsvetin (A. N. Bakhr Inst. Biochem., Acad. Sci. U.S.S.R., Moscow). Doklady Akad. Nauk S.S.R. 81, 220-6 (1951). — The substances chlorophyll ($a + b$) and (a) and (b), pheophytin, and phthalocyanin and its Mg complex were deposited on one of the 2 Pt electrodes by electrophoresis, by evap. of an ether soln., or by vacuum dist. (in the case of the phthalocyanins), and the potential (E) of the coated electrode was measured in a neutral KCl soln. on illumination. Illumination produced a change of E in the positive direction, except with phthalocyanin, where the change of E was neg. The magnitude of the change (ΔE) of E is proportional to the absorbed light intensity. The wave length which produces the photoelectrochem. effect coincides with the absorption spectrum of the film in the visible and near ultraviolet. Expts. with composite layers of substances giving ΔE of opposite signs proved that the effect is localized in the outer layer in contact with the electrolyte. Participation of dissolved O_2 in the establishment of the photo- ΔE is demonstrated by the fact that evacuation of air decreases the pos. ΔE . Dissolved quinone acts in the same way as dis-

solved O_2 . Addn. of reductants, such as $Na_2S_2O_4$, $Na_2S_4O_6$, hydroquinone, or ascorbic acid, either decreases the pos. ΔE or renders it neg. With the alc.-based phthalocyanins, expts. in alc. soln. gave the same results as in aq. soln. With phthalocyanins, ΔE is always pos., and higher in acid than in alc. soln. Chlorophyll and pheophytin in alc. soln. showed a neg. ΔE . When chlorophyll and pheophytin have ΔE of the same sign (neg. in alc., and pos. in acid soln.), the pos. ΔE is much higher with chlorophyll, with the previously observed (cf. C.A. 45, 27811), easier photoreducibility and more difficult photooxidizability of pheophytin as compared with chlorophyll. Similar effects were observed on graphite electrodes, but the effects were much smaller than on Pt.

Change of the absorption spectrum of solutions of fructose
on heating. V. B. Evstigneev and V. N. Nikitina (A. N.
N.S.S.R. 81, 1951-4 (1951); cf. C.I. 43, 1054).—Heating an
aq. soln. of fructose 30 hrs. causes a progressive change of the
absorption spectrum. Extinction coeff. of initially weak
bands at 280 and 290 m μ rise rapidly; the change is most
pronounced in the former band. In comparison with
changes in glucose solns. the change is some 7 times more
rapid. The spectrum after 30 hrs. is very close to that of
hydroxymethylfurfural. The pH of the medium alters the
rate of change. The change of the abs. max. at 290 m μ
shows a jump, at pH 3; that of 280 m μ , at pH 4-5, is short
lived, with indication of a shift to pH 3 for longer runs.

Isolation of phycocyanin from red algae, and its spectral and photochemical properties. A. A. Krasnovskii, V. N. Prud'yanov, G. P. Britz, and V. A. Gavrilova (A. N. Bakh Biochem. Inst., Moscow). *Doklady Akad. Nauk S.S.R.* 82, 947-50 (1962). —The best source from which phycocyanin can be extrd. by 24-hr. treatment with H_2O_2 is *Calothrix* (var. *relicta*). The product can be isolated by ppg. proteins with $(NH_4)_2SO_4$ and chromatographing on tricalcium phosphate, the raspberry-colored band of phycocyanin being found above the blue phycocyanin band. Washing (development) with 0.15 M $NaHPO_4$ is satisfactory. Ultracentrifuge studies show that the soln. contains 2 protein components, $S_r = 13.07 \times 10^{-11}$ sec. and 6.08×10^{-11} sec., mol. wts. being about 300,000 and 60,000, resp. The Iodius electrophoresis technique gives one sharp and one shallow peak. At isoelectric point of pH 4.5, the intensity of absorption is least. The main absorption max. at 575 m μ is highest at pH 7.0. The 666-m μ absorption band follows Beer's law. The substance displays fluorescence without concentration quenching. Photoxidation in air is negligible in sq. soln., but EtOH, dioxide, or pyridine accelerates it considerably; during oxidation the absorption max. at 666 and 640 m μ decline more rapidly than at 495 m μ , possibly owing to destruction of link between protein and erythrobilin. Expts. with photoreduction of phycocyanin by ascorbic acid showed stability of the compd. in this respect. The substance is not capable of realization of the isolated chloroplast reaction (photochem. evolution of O or H_2O), coupled with reduction of quinones); not only that, but it actually hinders the spontaneous oxidation of ascorbic acid and it cannot participate in H transfer from ascorbic or pyruvic acid to riboflavin, etc. Proteolytic enzymes can liberate erythrobilin, red, which oxidizes in air to blue product, probably corresponding to cyanobilin. A dialyzed soln. of phycocyanin hydrolysed by 15% HCl in the absence of air and treated with AmOH gives erythrobilin in the org. phase; the product shows absorption max. at 495 m μ , its oxidation product at 600 m μ . Electronic Phenomena

Chemical reduction and forms of chlorophyll and its derivatives. A. V. Andreev. Doklady Akad. Nauk SSSR, 1947, v. 59, p. 103-106. C. A. 47, 1964. Translated from Dokl. Akad. Nauk SSSR, 1947, 59, 103. Chlorophyll a and c are reversibly reduced by PhNHNNH₂ in toluene soln. forming semiquinonoid reduced forms of these pigments, which appear to exist in 2 forms - dissoed and undissolved, which differ in their absorption spectra. When a rapid scan of the spectrum of a soln. of chlorophyll a is made in toluene in the presence of PhNHNNH₂ after evacuation and 2-min. irradiation, the resulting curve has 4 max. at 518, 585, 666-70, and 415 m μ . When the soln. is permitted to stand in the dark, the spectrum changes slowly; the 670 peak increases, that at 518 declines in intensity, while the 585 max. rises briefly then declines once again. Addition of air accelerates these changes. While the original red max. of chlorophyll is 660 m μ , the reverse dark reduction brings about a max. formation at 670 m μ , indicating pheophytinization. The curve of the final oxidation product is that of pheophytin a. In the presence of pyridine the 585 m μ band disappears, EtOH acts similarly, but Air H causes a decline of the 518-m μ max. and increase of 415 and 585 m μ maxima. Thus the 518- and 660 m μ max. belong to 2 distinct substances - dissoed and undissolved forms of the reduction products. The reduced form of chlorophyll a shows fluorescence; excited by a Hg lamp it is orange-red with a definite band at 600-35 m μ ; on cooling with liquid N₂ green bands also appear (525-42 and 560-70 m μ). The latter 2 bands form only from reduced chlorophyll a which leaves the 518 m μ band. The similarly treated specimen of chlorophyll c has max. at 506 and 438 m μ , probably caused by dissoed and undissolved forms of semiquinones. Upon standing in the dark the pheophytinization does not occur and the final spectrum agrees completely with that of the original green chlorophyll b. Fluorescence of reduced chlorophyll is much more red than that of the original, showing a band at 610 m μ .

Title : Photo-reduction of a and b-pheophytines

Periodical : Dokl. AN SSSR, 96, Ed. 6, 1201 - 1204, June 1954

Abstract : Pheophytines like chlorophylls submit to photo-reduction in the presence of organic bases but the rate of the photo-reduction process for a and b-pheophytines is considerably higher than for a and b-chlorophylls. The reduction process and results obtained are described. Four references. Graphs.

YEVETKINE YEV. V.D.

... photooxidation of some dyes sensitized by
chlorophyll has been reported by B. Bystrov,
V. V. Kostylev, and N. S. S. R.
B. B. Bystrov and V. D. Yevetkina,
in a series of articles which support
the hypothesis of photochemical oxidation of
dyes. This phenomenon does not
occur in all dyes, however, for information and this
is due to the fact that the photo-oxidizing agent occurs with
different probability in different dyes. In this study was made photometric
experiments on the photo-oxidation of phloxalin in a color
solution at 440 m μ . The immediate
absorption maximum at 540 m μ absorption and
the absorption minimum at 570 m μ remain
unchanged. A series of photo-products is
formed during the experiment. After 2.5 min., this is
the most intense. It is formed only by photo-oxidation
and its absorption maximum is at 670 m μ (that is
at 230 m μ longer wavelength). Besides
this, the absorption shows a -10% in the dark. A
similar reaction is observed with phophytin b. Besides ad-
dition of chlorophyll riboflavin and methyl red as
photosensitizers in some cases a definite reaction is ob-
served. Chlorophyll presents some dif-
ferences from other photosensitizers, however, as the presence of
chlorophyll increases the photo-oxidation. 324

Title : About the change in electrical conductivity of chlorophyll solutions and suspensions of plants during light photo-reduction

Periodical : Sov. At. Energ. 1951, 47-50, No. 1, 1955

Abstract : Studies have been conducted concerning the photoconductivity of chlorophyll, carotinoids and chlorophylls of certain other pigments. The tests were carried out mostly in pyridine solutions with phenylhydrazine in the role of electrolyte. It is found that ferric chloride, an electrolyte increase the dark conductivity and decrease the relative change in conductivity during illumination and reduces the relative change in conductivity during photo-reduction of chlorophyll. The photoconductive properties of chlorophyll sensitized with ferric chloride are also studied. Three U.S.R. references (1949-1955).
